From S-band (DRAO) to C-band using

$$F_{\lambda} = p_{\lambda} \cdot (F_{10.7} - q_{10.7}) + q_{\lambda}$$

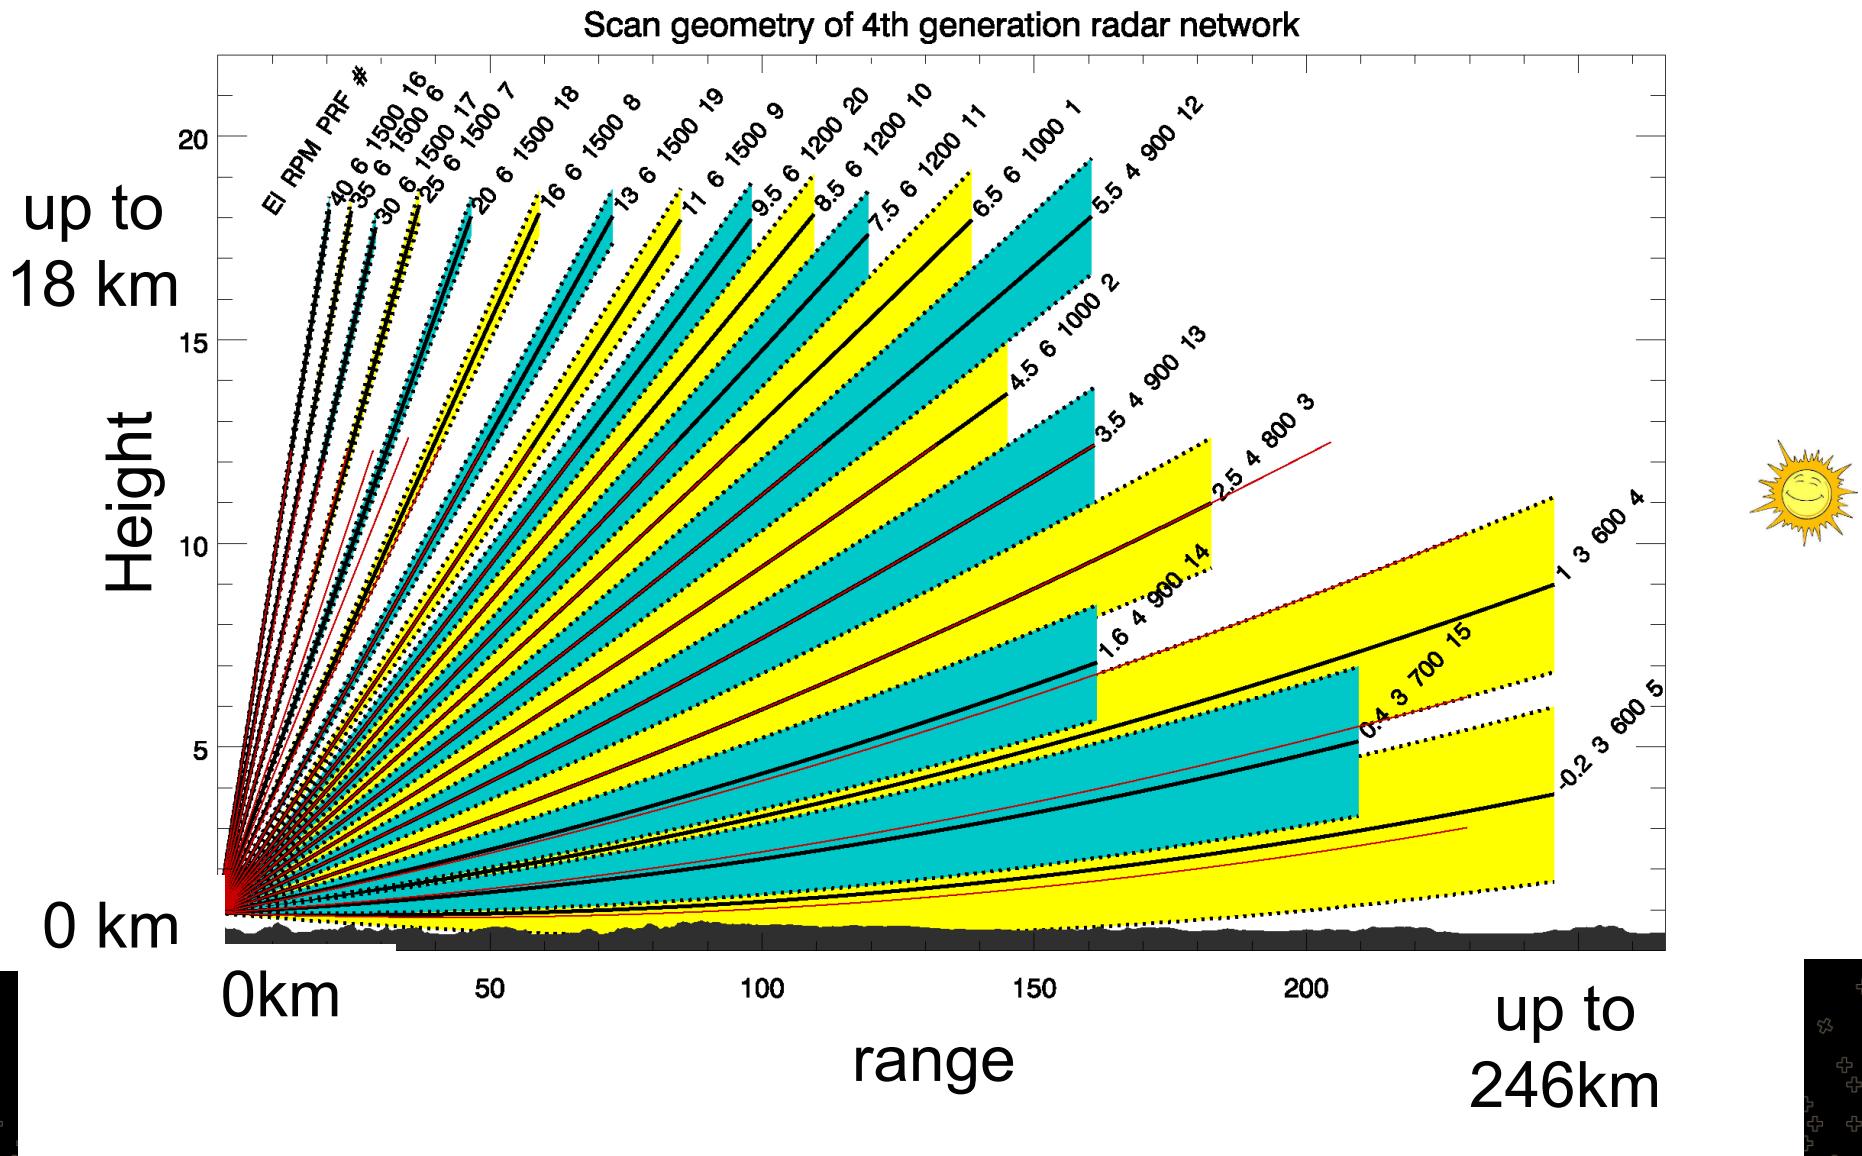

where $[F_{\lambda}] = [F_{10.7}]$ = solar flux unit (sfu)

1 sfu is equal to $10^{-22} \text{ W}\cdot\text{m}^{-2}\cdot\text{Hz}^{-1}$, which is $10^{-19} \text{ mW}\cdot\text{m}^{-2}\cdot\text{Hz}^{-1}$.

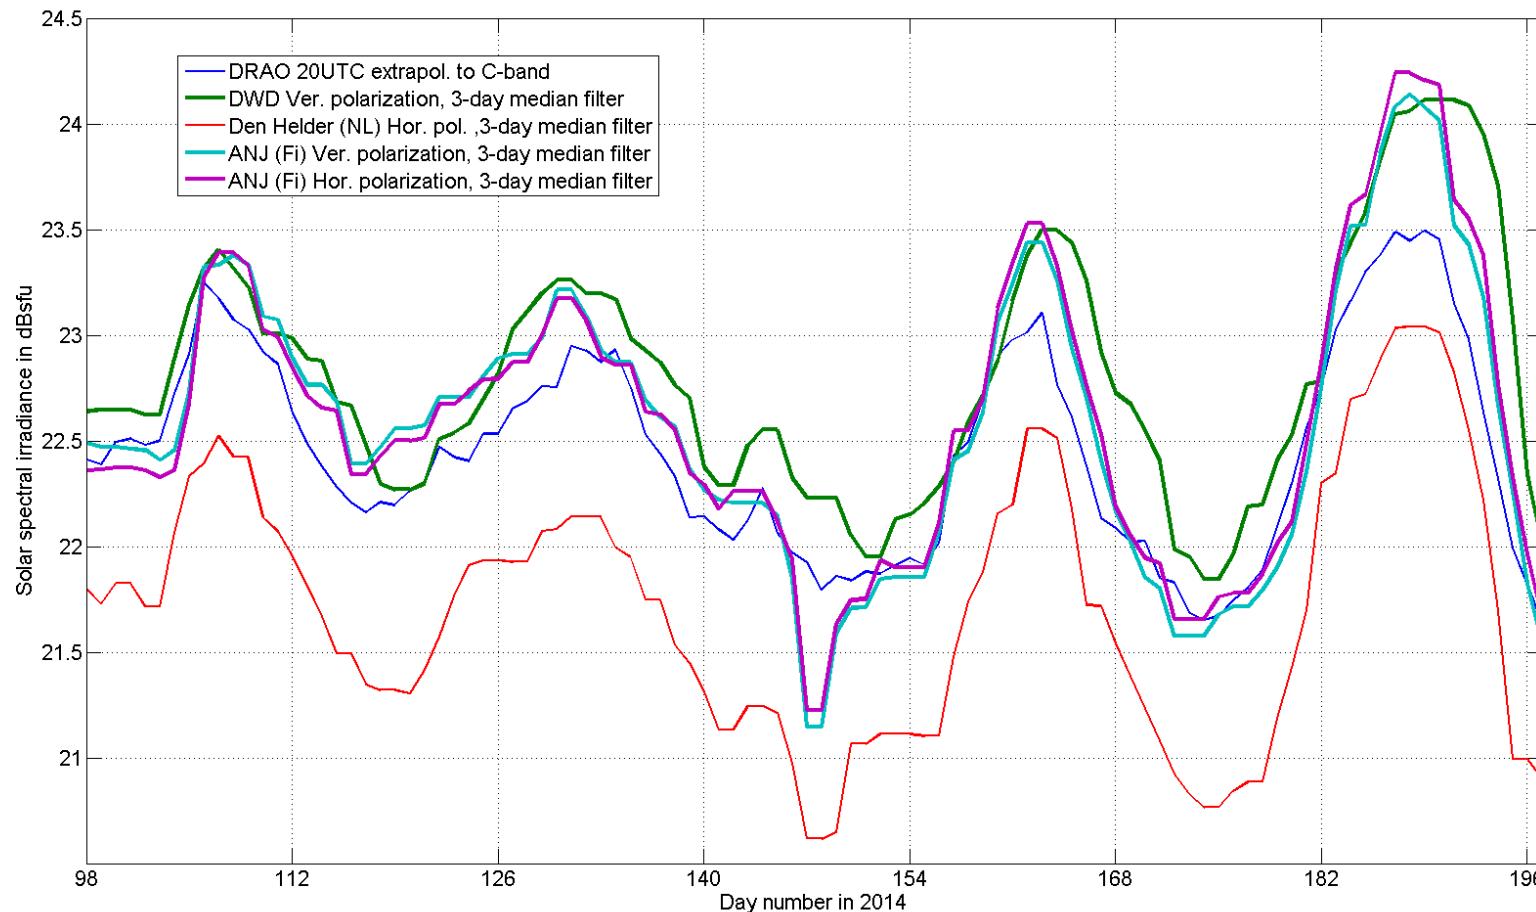

$q_{10.7}$ set to 64 sfu ($\sim 18.0 \text{ dBsfu}$);

$q_{5.5}$ set to 113 sfu ($\sim 20.5 \text{ dBsfu}$);

20 sweeps (>360°-rotation) every 5 minutes

2014: DRAO from S- to C- and 3 C-band radars

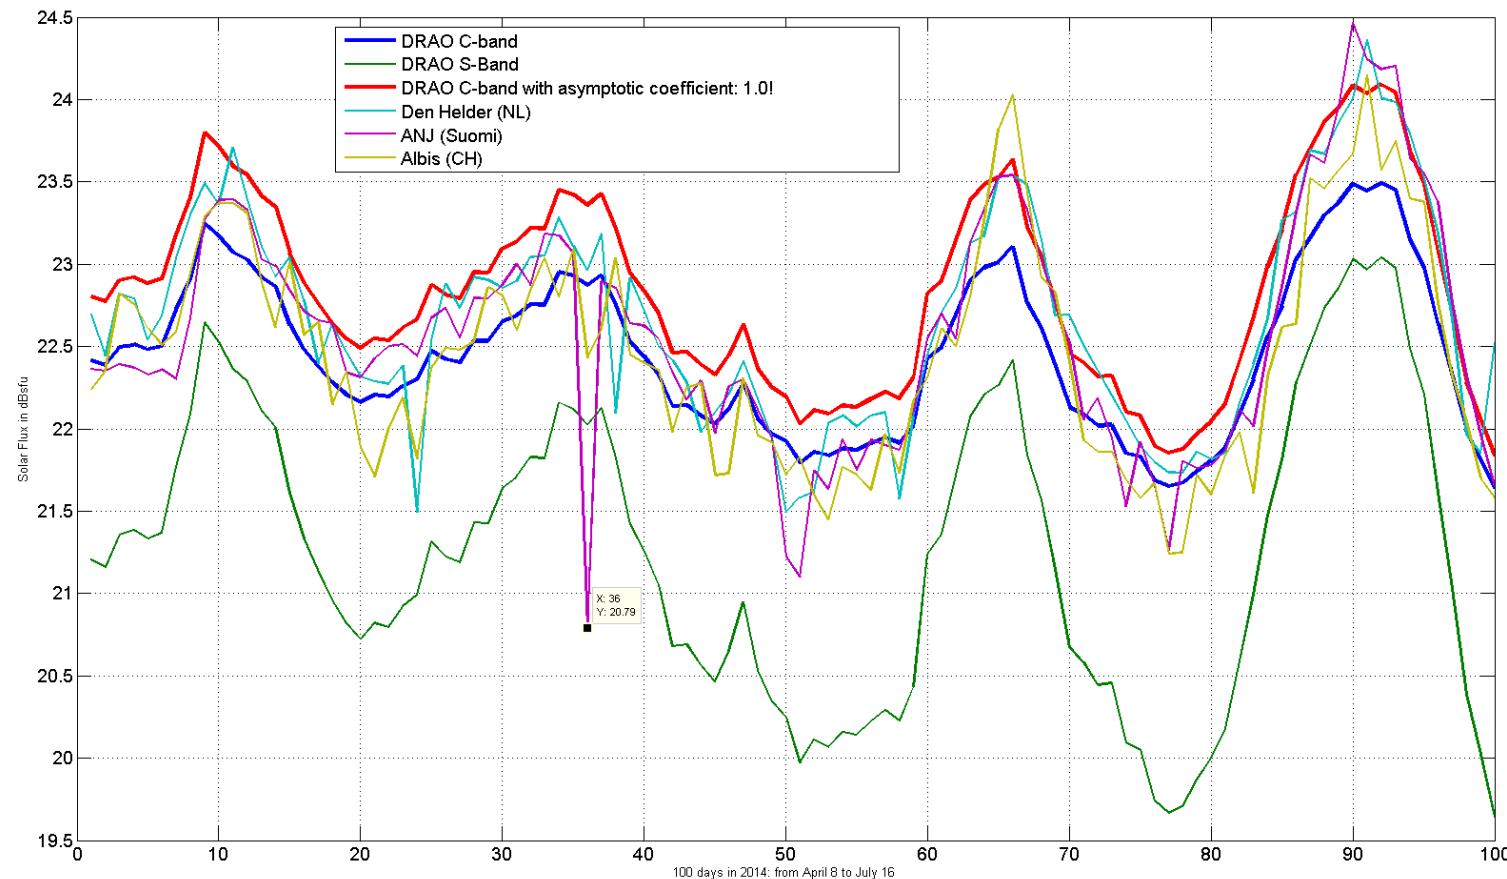

DRAO (1-hour; start 20 UTC) accurate measurement is the reference

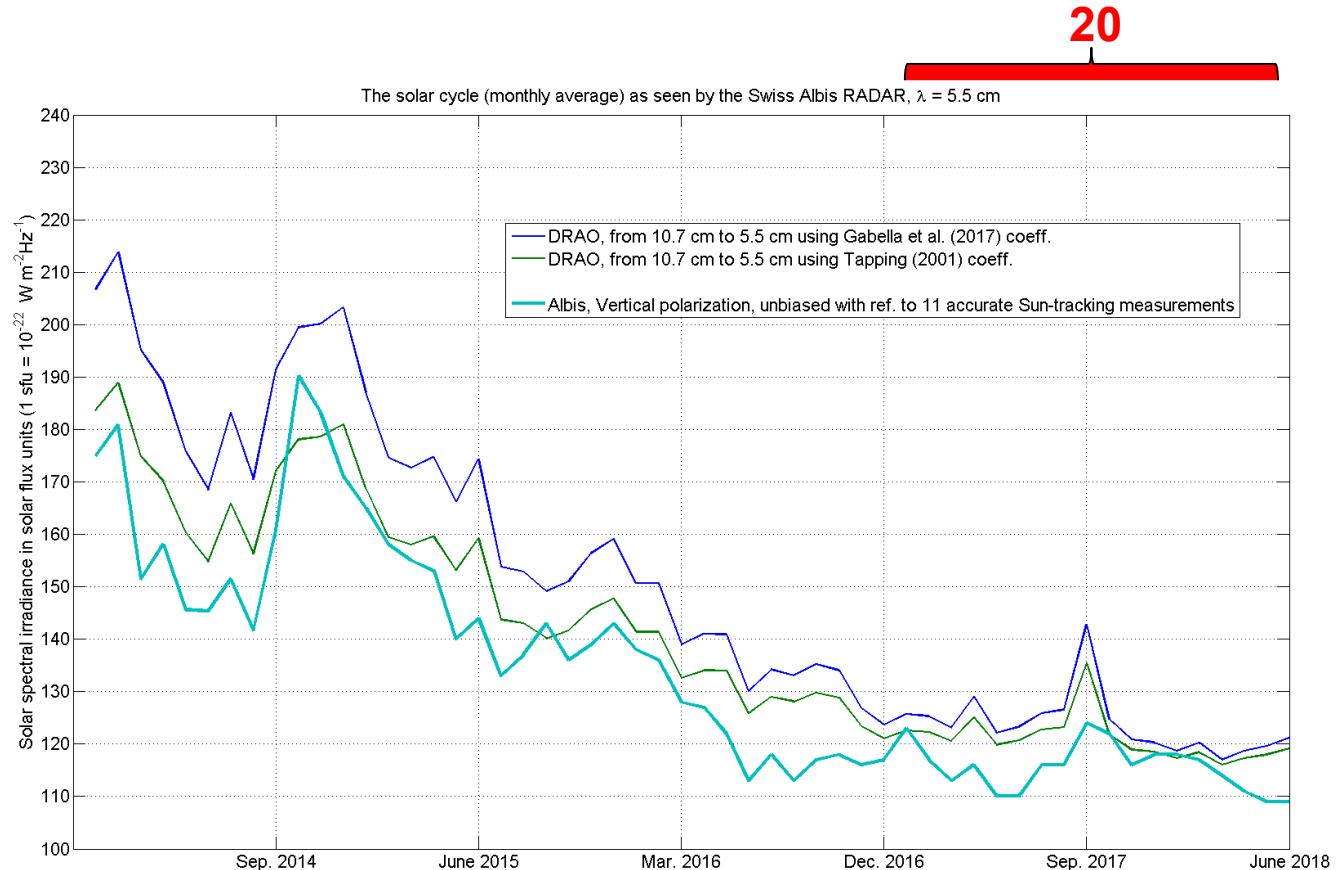

2014, daily estimates: 3 radars, two 5cm DRAO curves

$$(F_{5.5} - q_{5.5\text{cm}}) = p_\lambda \cdot (F_{10.7} - q_{10.7})$$

where $[F_\lambda] = [F_{10.7}] = \text{solar flux unit (sfu)}$
